

Renforth Resources Inc. Provides Shareholder Update

PICKERING, Ontario, February 12, 2025 -- [Renforth Resources Inc. \(CSE: RFR\) \(OTC: RFHRF\) \(FSE: 9RR\)](#) (“Renforth” or the “Company”), would like to update shareholders on current project activities for our wholly owned Parbec Gold Deposit beside the Canadian Malartic Mine in Malartic Quebec and our nearby wholly owned ~300 km² Malartic Metals Package property, hosting several areas of critical minerals mineralization, including the ~20km long Victoria nickel sulphide polymetallic structure.

Parbec Gold Deposit

- The update to Parbec's Mineral Resource Estimate is ongoing, with completion expected this quarter. The project database has been updated and validated to include approximately 15,000 meters of drilling conducted by Renforth after the December 2019 effective date of the historic MRE, as well as around 13,000 meters of drilling from the 1980s and 1990s that were not included in the historic MRE but have been validated by Renforth with subsequent drilling.
- TOMRA testing will provide valuable data for Renforth's ongoing investigation into the anomalous presence of copper and silver, as well as occurrences of zinc, molybdenum, and tungsten, within the diorite/magnetic diorite at Parbec. Diorite is also the primary lithological host for gold at Parbec. To date, Renforth has limited information regarding the critical minerals within the diorite, as multi-element testing has only been conducted once on a small number of pulps and rejects. Preliminary thin section analysis identified chalcopyrite in core samples. TOMRA technology offers the potential to concentrate sulphides, thereby reducing waste and enhancing the grade of these elements.
- Witness core was recently sampled from the Parbec core library for the MRE update. After internal gold assaying, reject material will be tested for multi-elements. Additionally, Renforth will test diorite/magnetic diorite core from the Parbec core library for critical minerals when seasonally appropriate.

Malartic Metals Package property

- Core samples from within the 2.5 km drilled area of the approximately 20 km long Victoria structure have been submitted for QEMSCAN testing. This will provide Renforth with initial characterization information, including the elements forming the nickel, zinc, and other mineralization. This is the first step in assessing the metallurgical characteristics of mineralization. Results will be released when received.
- Renforth has completed a desktop study to assess the potential for Rare Earth Elements (REEs) within the Malartic Metals Package property. Despite limited previous exploration and assaying for REEs, a high-priority target has been identified south of the Victoria structure, near the previously identified Lithium Anomaly A area and the contact zone between the Decelles Batholith and Pontiac Sediments. The area of interest contains a REE occurrence within granodiorite. Renforth plans to conduct follow-up exploration on both the newly identified REE anomaly and the Lithium Anomaly A area during the upcoming summer field season.

Shareholder Events

- Renforth will host a webinar on March 5, 2025, at 7 pm. Registration is free but required. Link: <https://events.ftmig.ca/follow-the-money-investor-gr/Renforth-Resources-Company-Update-and-Overview-acd2393047d34181599a9cdb>
- Visit Renforth at PDAC 2025, booth #2136. Meet management and the technical team. For a specific meeting time, email nicole@renforthresources.com.
