- all holes are uncut and over core length; core length is estimated 50-90% of true width; 1 g/t Au multiplied by 0.0291666 equals troy ounces per short ton (to convert from metres to feet multiply by 3.2808).

QA/QC was followed in sampling the NQ core. The core is sawed in half for sampling. Standards, blanks and duplicates were inserted into the stream of core samples every 20 m. The core was assayed at Expert Laboratory Inc. in Rouyn-Noranda, Quebec using 30 gram samples. The core samples were analyzed using the fire assay method and AA finish. Assays of 1 g/t Au and greater are reassayed using the gravimetric method. Fred Sharpley, P.Geo is the QP for the Omega Property.

Commenting on the intersection; Robert Kasner President and CEO stated that this is very encouraging drilling to date has surpassed our expectations and it appears we are developing a new mine out of an old one. We still have assays to come from other deep holes and the potential open pit area. We expect to start another 10,000 metres program by month's end. In the mean time drilling is continuing with one drill.
