

Spearmint Significantly Increases Acreage on the Sisson North Tungsten Project in New Brunswick

Vancouver, British Columbia--(Newsfile Corp. - April 14, 2025) - **Spearmint Resources Inc. (CSE: SPMT) (OTC Pink: SPMTF) (FSE: A2AHL5) (the "Company" or "Spearmint")** wishes to announce that it has significantly increased the acreage of the 'Sisson North Tungsten Project' in New Brunswick directly bordering the Sisson Tungsten Mine. This new project now consists of approximately 4,890 contiguous acres increased from 2,582 prospective for tungsten.

James Nelson, President of Spearmint stated, "There continues to be strong demand for commodities caught in the middle of global tariff battles—particularly tungsten. Considering these developments, we believe there will be increasing emphasis on securing domestic sources of strategic materials. With commodity prices remaining elevated and gold at all-time highs, we anticipate a much more buoyant junior mining market. With multiple active projects, Spearmint is well positioned to take advantage of these market conditions."

In April 2025, China's export controls on tungsten continued to impact global supply chains and market dynamics. These measures, initiated in February, require exporters to obtain licenses for shipping tungsten and other critical minerals abroad, citing national security and non-proliferation concerns.

The restrictions have led to increased prices and supply uncertainties, particularly affecting industries reliant on tungsten, such as defense and clean energy sectors. Analysts anticipate that Chinese-supplied tungsten may be scarce in the global markets.

In response to these challenges, companies and countries are exploring alternative sources and strategies to mitigate the impact of China's export controls on tungsten.

Tungsten has always been a valuable material due to its unique properties, such as its extremely high melting point, strength, and durability. It is used in a wide variety of applications, including manufacturing hard metals, electronics, lightbulb filaments, and in military and aerospace technologies. However, China's actions regarding tungsten have made it even more valuable for several reasons.

In short, the combination of China's tightening control over tungsten production and the growing demand for this critical material has made tungsten even more valuable on the global market.
