GREAT THUNDER RECEIVES URBAN THUNDER SOIL SURVEY RESULTS

VICTORIA, BC, November 20, 2017 – Great Thunder Gold Corp. (TSXV: GTG) completed a soil geochemistry survey between October 9 and October 16, 2017 on its 100%-owned Urban Thunder property located in the Windfall Lake gold camp of Quebec. The survey was undertaken on GPS lines 400 metres apart with sampling every 100 metres. A total of 301 samples were drawn, to the extent possible, from the B soil horizon and were sent for analysis at ALS Canada's laboratory in Val d'Or, Quebec.

The samples were analyzed using ALS codes Au-ICP-21 and ME-ICP41. Au-ICP21 consists of analysis of gold by fire assay with an ICP-AES finish on 30-gram samples. The detection limits of this method are from 0.001 g/t to 10 g/t gold. The samples were then submitted to the second analytical method – ME-ICP41 – where elements are estimated using aqua regia digestion followed by analysis using ICP-AES. Included in this package of 35 elements are silver, arsenic, copper, nickel and zinc.

Results from the laboratory have only just been received, but a preliminary evaluation revealed several gold anomalous results up to 24 ppb, mainly obtained on the northern part of the property. Further analytical verification is required with the laboratory before proceeding with the final evaluation of all the data obtained. A full report will follow in the coming weeks.
