

King Global Applies for Drill Permits on 11 Targets on Golden Nugget and Miss Pickle Properties

Toronto, Ontario – March 29, 2022 – King Global Ventures Inc. (TSXV: KING) (OTC: KGLDF) (FSE: 5LM1) (the "Company") has engaged Environmental Applications Group Inc. ("EAG") for permit applications and are concluding discussions with diamond drill contractors for a Phase 1 drill program to test on 11 prospective targets on its Golden Nugget and Miss Pickle Properties in the New World Island and Coaker Gold Trends of Newfoundland.

The program will test gold targets identified by King from previous prospecting work completed by Rubicon Minerals and King's recent exploration activities. The New World Island trend includes gold showings along a structural corridor that trends northeasterly along the southern shore of New World Island and includes the surface gold showings: Gina, Big Island, Red Fox, Hard Rock, and Big Oz and others.

The Coaker trend includes three showings that are associated with the Coaker Porphyry in the shallows that run between Coaker and Dunnage Islands. Coaker Trend targets include Hy-Grade, Miss Pickle and Quinlan Island where anomalous gold values have been confirmed associated with quartz veins and associated alteration (McNeil, 2004)

The permit application for the proposed Phase 1 drill program will anticipate 24 drill holes from 8 drill sites for a total of 3,022 meters of drilling. Drilling operations will be barge-supported as drill sites will be accessed by tide-water. The proposed drill program anticipates a mid-May start and will last approximately six-weeks.

Robert Dzisiak, Chief Executive of King stated, "Our technical team has identified multiple high value drill targets on our Golden Nugget and Miss Pickle Properties. We are very excited about commencing our maiden drilling program and moving King forward after a significant ground exploration program."

Newfoundland Properties:

King Global's projects include 100% interest in the following gold exploration projects:

The Golden Nugget Property consists of a 10 km long contiguous land package (1,850 ha.) of siliciclastic sediments within beds of conglomerates and mafic materials. High grade gold occurs in all rock groups with channel samples having returned values of 50.2 g/t gold over 1.1 m, 87 g/t over 0.8 m and 29.2 g/t over 2.5 m. These high grade channels are contained within extensive areas of lower to medium grade gold values along the entire length of this 10 km structural corridor.

The Miss Pickle Property (950 ha), is also north of the Davidsville Group and lies in another parallel structure to the Golden Nugget Property known as the Coaker Trend. Historical grab samples include 7.3

g/t gold over 2.05 m, 8.3 g/t gold over 1.9 m and 7.1 g/t gold over 1.2 m. The length weighed average of 26 channel samples across the zone is 3.2 g/t gold. A new gold zone with overall channel sampling of 0.30 g/t Au over 54 m, including 0.96 g/t Au over 7.5 m was discovered during the summer of 2021 (the zone is open in all directions).

The Gold Boulder Prospect consists of four contiguous claim blocks (100 ha) and is located near the small town of Glenwood in Central Newfoundland. Geologically the property is underlain by siliciclastic sediments of the Davidsville Group which is the same geological belt which hosts New Found Gold's (NFG-TSX) high grade Queensway project. The entire prospect is bound on all side by New Found Gold Corp.

The Chapel Island Property (1,300 ha) consists of 54 mining blocks located in north-east central Newfoundland, on Chapel Island within the Dunnage Tectonostratigraphic zone of the Appalachian Orogen. The Road zone consists of 4 historical showings containing numerous Au occurrences. These occurrences have returned individual assay results up to 85 g/t Au and 32 g/t Au. Chapel Island also has historical nickel showings grab samples up to 3.05% Ni.

The Lost Swamp showing is comprised of a silicified and carbonate altered Coaker porphyry that contains very, fine grained arsenopyrite, with assay results returning values up to 149.8 g/t Au and 23.3 g/t Au. At the Swamp zone, a total of 35 channel samples were cut for a combined length of 35.9 m at 8 different locations in the old trench. The best results from the sampling were 5.2 m of 484 ppb Au and 0.9 m of 3.9 g/t Au.
