Deer Horn Metals Expecting NI 43-101

VANCOUVER – March 1, 2012 Deer Horn Metals Inc., which is exploring a rare near surface high grade Tellurium/Gold/Silver and Tungsten property in British Columbia is anticipating receiving an updated NI 43-101 report this month. The report is expected to expand the Gold/Silver resource from the original 2010 report. The report will also serve to provide an initial resource calculation on the Tellurium. The Tellurium drill results at the Deer Horn property have provided some of the highest grades on record. Tellurium is one of the rarest metals in the world, and was identified in the *2011 U.S. Endangered Elements List* as the third most endangered element. As a point of reference, some of the rare earths are hundreds of times more common than Tellurium.

The 2011 drilling program at Deer Horn was extremely successful for a few reasons. Firstly we encountered mineralization in 49 out of 49 holes drilled. Secondly we demonstrated the near surface mineralization extended to a distance of at least 875 meters and is open in three directions. Upcoming NI 43-101 reports calculations will be based on approximately 450 meters of the mineralization. Therefor we know that for the next drilling program we will be in-fill drilling on at least 425 meters to add additional resources.

Thirdly, with a limited budget allowing for only 6 drill holes and minor trenching, we have demonstrated a significant presence of Tungsten at the Deer Horn property. The six holes confirmed that Tungsten was evident over an area of at least 550 meters, including some high grade samples. For your reference Tungsten was ranked as the fifth most endangered element on the 2011 U.S. endangered elements list.

We look forward to providing the updated NI 43-101 as soon as it is received.

Bob Lane P.Geo is the qualified person for the Deer Horn project.
