DESCRIPTION OF THE BUSINESS

The Company is a mineral exploration company focused on the acquisition and exploration of mineral resource properties, primarily gold and silver prospects in the province of Ontario, Canada and in the states of Montana and Nevada, USA.

The Company is a reporting issuer in the Province of Ontario and its common shares trade on the Canadian Securities Exchange ("CSE") under the symbol PMC, and on the OTC QB Market in the United States under the trading symbol PMCCF.

CORPORATE ACTIVITIES

GOLDEN TRAIL PROJECT, ELKO COUNTY, NEVADA

The Company began a core drilling program in late 2016 and plans to complete the program in 2017. The program is designed to establish structural and zonation controls on mineralization along generally northwest-striking trends of mineralization and alteration.

Early results from the drill core showed anomalous and coincident values in gold, silver, arsenic, antimony, and thallium in most of the 121 core samples. As a group, these five elements are considered indicators of Carlin-type mineralization. All rock types are strongly hydrothermally altered breccia, limestone, and calcareous siliciclastic sedimentary rocks. Surface outcrops are limited and more drilling is required to confirm structural and zonation controls on mineralization in three dimensions.

In order to guide exploration drilling, Peloton geologists are currently integrating the recent multi-element geochemistry and assays from drilling with hyperspectral mineralogy of the drill core and earlier hyperspectral analyses of outcrop samples, both by Terracore, Inc., and recent airborne hyperspectral mineralogical data by SpecTIR LLC. These combined technologies have been shown to improve exploration success in lithologically similar and structurally complex settings such as the Long Canyon gold deposit in the Pequop Mountains to the south of Golden Trail.

Mineralization at the Golden Trail Project is similar in geologic setting, host rock lithology, alteration and gangue mineralogy, and geochemistry to sedimentary rock-hosted gold deposits and especially gold mineralization typical of eastern Nevada, including the Carlin-type Long Canyon gold deposit in the Pequop Mountains.

Subsequent drill programs would seek to expand on this initial program along strike, at depth, and in other areas of the property. A large gravity anomaly underlies the Golden Trail claim block and the Company plans to test that in subsequent programs
