Copper Reef Finishes Drilling on Smelter Claim

Copper Reef Mining Corporation (“Copper Reef”) wishes to report that it has finished drilling drill hole SM-11-3 on its Smelter Property. The drill hole was targeting a deep seismic target just north of the Hudson Bay Smelter and the Callinan and Triple Seven Deposit. The drill hole was drilled through Missi Sediments and the basal conglomerate where it then encountered mafic rocks and feldspar porphyries. Within this mafic section, a 5.1m zone of stringer sulphides was intersected from 2188.5 to 2193.6m at a vertical depth of around 1850m. The sulphide section has been cut and sent for assay. The hole ended in granodiorite at 2582m representing a vertical depth of 2155m. This fall, a large surface loop, possibly 2 km square, is planned to be laid around this hole. HudBay Minerals will carry out down hole pulse electromagnetic surveys down this and other drill holes, within the large surface loop, to test the extent of the sulphide zone and to possibly vector in to more conductive massive sulphide areas.

ABOUT COPPER REEF MINING CORPORATION

The Corporation is a Canadian junior mineral exploration company with a specific focus on mineral properties in Northwest Manitoba and Northeast Saskatchewan, Canada. All of the Company’s properties are currently at the exploration stage. The Company, which has no long-term debt, has assembled a portfolio of base metal and precious metal prospects, including strategic locations in the Provinces of Manitoba and Saskatchewan and has the resources to fund further exploration.
