Rockland Minerals Provides Update on Summer Exploration at Blue Lake PGE-Cu-Ni Project, Labrador Trough, Québec

Vancouver, British Columbia, June 10, 2015 - Rockland Minerals Corp. (TSX.V: RL) (the “Company”) is pleased to provide an update on its 2015 exploration plans at the Blue Lake/Retty Lake PGE-Cu-Ni Project near Schefferville, Québec. Rockland has analyzed the results from combined geophysical, geochemical and geological surveys and a recent geophysical inversion study over the expanded project area to constrain drill targeting.

The inversion study enables Rockland to define the geophysical signature of the Blue Lake mineralized zones, and to project this knowledge to define new drill targets. Relatively flat-lying conductors defining the down-plunge extension of the Blue Lake mineralization are especially favourable target areas for the discovery of new PGE-Cu-Ni mineralized zones. The Company has made the geophysical report available on its website (www.rocklandminerals.ca).

Numerous priority drill targets have been identified. Planning is underway for a summer detailed portable XRF and ground mag-VLF survey, followed by drilling. The ground target validation process will help constrain our drill targets and the likelihood of successful drill intersections.

George F. Sanders, P.Geo, stated: "This new geophysical interpretation is showing us possible mineralized feeder structures at our Lost Lake and Starr Lake PGE-Cu-Ni zones, and at Flying Duck Lake immediately adjacent to the Blue Lake massive sulfide occurrences. Defining feeder zones for the Montagni Group (Blue Lake South) of mafic and ultramafic sills will be an important step towards new discoveries in the District. Rockland will provide further updates as we get closer to the start of the program."

George F. Sanders, P.Geo, is a Director of the Company and person responsible for the technical content of this news release.

We seek Safe Harbor.

On behalf of the Board of Directors

“Rav Mlait”

President and CEO
