SCHEDULE "B" CLAIMS PORTFOLIO

The project consists of three separate claim blocks that were carefully selected to cover the best sampling results (greater than 0.20% nickel in rocks) reported by Nanton Nickel company in 2013 shortly after the discovery of the Decar Nickel property. Awerite was confirmed to be a constituent of the nickel values.

Summary

The Murray Ridge Property is located approximately 15 to 30 km northwest of Fort St. James and 120 km northwest of Prince George in central British Columbia. The property consists of 42 contiguous mineral claims which are 100% owned by Nanton Nickel Corporation of Vancouver, BC. The claims total 17,789 ha, and are centered in BC's Omineca Mining Division, at approximately 124°18.7' W Longitude and 54°32.8' N Latitude, on NTS map sheets 93K/8,9,10. Accessibility to the property is provided by well-maintained gravel roads from Fort St. James off Highway 27.

Previous exploration in the region identified numerous mercury showings associated with the regional Pinchi Fault structural zone as well as chromite-low platinum-group-element occurrences hosted within ultramafic-mafic intrusions. Nanton Nickel Corp. has undertaken evaluation of this property for nickel-iron alloy mineralization (awaruite) in tectonized and serpentinized ultramafic rocks of Cache Creek Group Trembleur Intrusions. This is the first known attempt to locate awaruite in the area. The geological and structural setting of the MR Property is analogous to the Decar Project (First Point Minerals Ltd.) located approximately 60 km to the northwest.

The Murray Ridge Property is underlain by the Lower Pennsylvanian to Middle Triassic Cache Creek complex; a mixture of calcareous and clastic sedimentary rocks intruded by the Trembleur ultramafic and Rubyrock mafic intrusions. The Triassic to Jurassic Takla Group and Tezzeron Sequence are located along fault bounded contacts with older assemblage. The youngest is tonalite of the Cretaceous Endako Batholith. Northwest striking faults and thrusts, including the known Pinchi Lake Fault system, are characteristic of the strong, structural trend throughout the region.

The 2012 exploration program involved reconnaissance prospecting and geochemical soil sampling. A total of 55 rocks and 142 soil samples were collected from prospective areas throughout the Murray Ridge property. These were analyzed for a multitude of elements by ICP-OES method and for magnetic content by Davis Tube method at AGAT Laboratories in Vancouver. In addition, 54 samples were analyzed by Vancouver Petrographics Ltd. of Langley BC using polished thin section and semi-qualitative energy dispersive spectral (EDS) analyses.

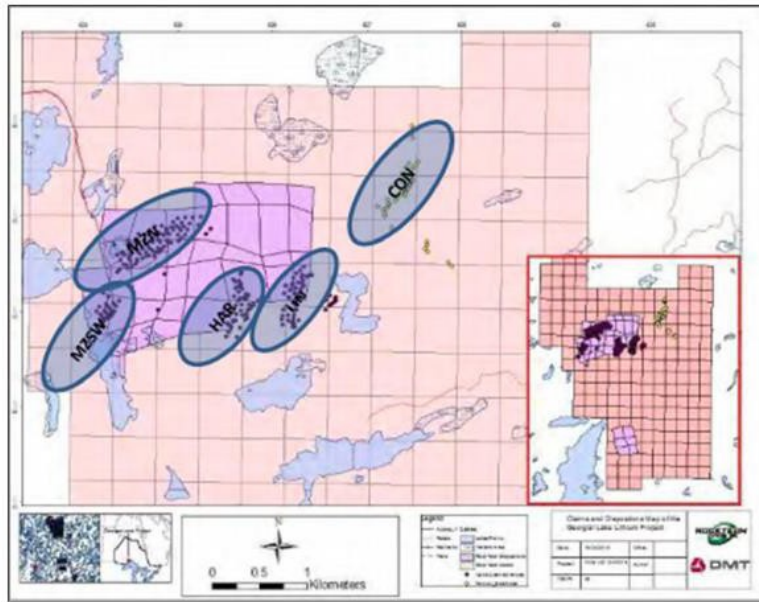

Geochemical sampling has confirmed the presence of trace nickel-iron (awaruite) mineralization from perspective ultramafic-mafic rocks on the property. Rock and soil geochemistry returned anomalous nickel contents with best assays of greater than 2000 ppm Ni in rocks and 1000 ppm Ni in soils, respectively. Further prospecting, rock sampling and geological mapping should be conducted to further assess the potential for awaruite mineralization on the property.

About the Georgia Lake West & North Lithium Properties

The Georgia Lake West and North Lithium properties are contiguous to RockTech Lithium (RCK – CSE) Georgia Lake Property is located approximately 160 km northeast of Thunder Bay within the Thunder Bay Mining Division and is host to a number of spodumene-bearing pegmatites. Lithium mineralization was discovered in 1955 and subsequently explored by several historic owners. RockTech acquired the licenses since 2009 and carried out several drill campaigns until 2017. Based on a total of 351 drill holes with a combined length of 47,384 m an NI43-101 compliant resource estimate of 6.58 million tonnes in the measured and indicated category and 6.72 million tonnes in the inferred category was published in August 2018.
