ACME Lithium recently announced that it had successfully completed hole DH-1 at its Clayton Valley lithium brine project to a total depth of 1400 feet or 427 meters below ground surface. Prospective basin sediments have been encountered and delineated as highly probable for aquifer units based on permeability features, lithology, and color. Sampling is ongoing and will target stratigraphic features expected to contain brine. These samples are being sent to an independent lab and analyzed for lithium, boron, and other minerals typical of lithium enriched brine systems.
