

SENTINEL COMMENCES SUMMER 2020 WORK PROGRAM AT PASS PROPERTY

Vancouver, British Columbia, July 7th, 2020 – Sentinel Resources Corp. (CSE: SNL)(US OTCQB: SNLRF) (“Sentinel” or the “Company”) is pleased announce that the 2020 work program at the Company’s 100% owned Pass property, located near Castlegar, B.C., is now underway.

Company President & CEO, Rob Gamley, commented, “I am pleased to get this work program underway. Our technical team has designed a logical and promising plan. Although the initiation of the work program was delayed by several weeks due to COVID-19 related concerns for work crew members and access due to weather and ground conditions, we are excited to be back in the field exploring what we think is a highly prospective property.”

The first phase of the 2020 field season’s efforts are focused on further investigation of the geophysical anomalies through collection of detailed soil geochemistry over the anomalous locations along with detailed mapping, prospecting and rock sampling in the main mineralized area, known as the Granite Creek skarn. In addition, Sentinel field crews are also following up anomalous copper-gold mineralization in rock samples discovered due to recent logging activity on the property and located in a previously unexplored area. The Company plans to collect detailed soil geochemistry in this unexplored area along with detailed geological mapping and prospecting and rock sampling. A second phase of field work is planned in 2020 to follow up on those targets successfully characterized in the first round of field work.

Prior to commencing the current field work program, the Company completed a detailed compilation of existing data for the Pass property, and designed a field program consisting of geological mapping and prospecting and the collection of soil and rock samples. The 2017 field program conducted by a previous operator verified the results of historical work and identified additional targets for follow up this field season. Ground magnetometer and IP geophysics have highlighted several locations that exhibit coincidental anomalies and are worthy of further investigation.

The Pass property is located within the Nelson mining district, where numerous high-grade gold occurrences and deposits have been discovered in quartz veins, sulfide zones and skarns adjacent to the contact of mid to late Jurassic intrusions such as the Bonnington Pluton and the Rossland Group volcanics and sediments. The area has been actively explored since the late 1800’s.

The Pass property shares similar geology to the third largest gold-enriched skarn producer in the province, the Second Relief mine, which is located 2.5 km to the east of the property. The main mineralized zone on the property is referred to as the Granite Creek skarn and is a steeply dipping stratiform, tabular or lensoidal zone of gold enriched skarn. This body has had only historical

artisanal work performed on it as evidenced by a short adit on the south bank of Granite Creek. Samples from the tailings pile of the adit assayed up to 9.2 g/t gold and 50g/t silver.

A second mineralized zone is located approximately 460m northwest of the Granite Creek skarn in a shallow trench located in a clear cut above the Munson Forest Service road. Samples of a silicified hornfelsed mineralized volcanic taken from the open cut assayed up to 4.68 g/t gold. (Assay information has been drawn from the Company's Technical Report, available under Sentinel's profile on SEDAR at www.sedar.com.)

About Sentinel Resources

Sentinel Resources is a Canadian-based exploration company focused on the acquisition and exploration of prospective resource properties. Its current portfolio includes the Pass and Little Bear projects in British Columbia. The Company's guiding principles are based on acquiring strategic exploration properties in mining-friendly jurisdictions with historical mining industries, low-cost of entry or acquisition, and easy access to infrastructure to minimize capital and operational costs in explorational periods.
