**GROUND CREWS COMMENCE WORK ON ARCTIC FOX LITHIUM CORP.'S PROJECTS IN
THE JAMES BAY REGION OF QUEBEC**

VANCOUVER, BRITISH COLUMBIA (October 3, 2023) – Arctic Fox Lithium Corp. (CSE: AFX / FSE: O5K) (the “**Company**”) is pleased to announce that its contractor, Strategy Exploration Advisors (“**Stratexplor**”), an independent exploration consulting firm based out of Rouyn-Noranda, Québec, has begun fieldwork on the Company’s lithium projects in the James Bay Region of Québec (the “**Properties**”). Stratexplor crews will be responsible for conducting surface exploration on the Properties, including field logistics, sample collection and dispatch, geological mapping and interpretation, exploration targeting and advising as per National Instrument 43-101 collection and reporting guidelines. The Company has provided Stratexplor with data from the Company’s recent LiDAR survey, data compilation done by Noranda Royalties Inc. and a high level review done by Resources Potentials Pty Ltd. to assist its ground crews on targeting potential Lithium-Caesium-Tantalum (“**LCT**”) pegmatites on its projects. The exploratory fieldwork to be conducted by Stratexplor commenced on October 2, 2023 and is anticipated to last approximately 28 days in total.

Mr. Harry Chew President and CEO to the Company, commented: “I am extremely happy that the bans from the devastating forest fires in the area have been lifted and we are now able to take advantage of the short window to have ground crews on our projects this year. I am excited to review the results of the fieldwork and to confirm the presence of any potential LCT pegmatites on our properties.”

About Arctic Fox Lithium Corp.

Arctic Fox Lithium Corp. is a junior mineral exploration company focused on the acquisition and development of mineral properties containing battery, base and precious metals.

The Company’s 5,976 hectare Kana Lake Lithium project is located north of the Fliszar Lithium showing in the James Bay region of Québec. During a summer/fall 2022 survey program conducted by the Québec Ministère de l’Énergie et des Ressources Naturelles (“**MERN**”) their geologists identified this area as a new lithium prospective zone that is characterized by the presence of numerous E-W trending pegmatitic granite dykes. The presence of garnet and muscovite in these rocks indicates a hyperaluminous composition, suitable for the development of lithium mineralization. These pegmatites are consistent with the Fliszar Lithium showing to the south of the property which three grab samples rich in lepidolite, returned up to 1.83% LiO₂, 0.34% Cs, 1.11% Rb, 126 ppm Nb, 374 ppm Ta and 0.3% Be*.

The Company’s 2,756-hectare Pontax North Lithium Project (“**Pontax North**”) is located 12 km south of Allkem Ltd. (ASX/TSX:ALLKEM) (“**Allkem**”) James Bay Lithium Project and 12 km north of Stria Lithium Inc.’s (CSE:SRA) Pontax Lithium Project, located in northern Québec, approximately 130 km east of James Bay and the Cree Nation’s Eastmain community.

The northern portion of Pontax North contains a lithium prospective zone in a similar geological environment to Allkem’s project. According to the Quebec Ministère de l’Énergie et des Ressources Naturelles (MERN) this zone is characterized by the abundance of S-type pegmatitic granite intrusions, a lithology known for its Be, Li, Nb, and Ta potential. Beryl (a beryllium silicate mineral) is reported in several outcrops within this zone. The Property is known to contain a 10 km long pegmatite trend as mapped by MERN. This trend appears to be underexplored, despite its recognized lithium potential. Swarms of lithium-bearing granitic dykes are present 12 km north of the Property at Allkem’s Cyr showing and at Stria Lithium’s Pontax showing 12 km to the south.

Allkem is proposing to develop a lithium mine at their James Bay Lithium Project, located adjacent to the Billy Diamond Highway which provides access to key infrastructure in the region. The 2021 Feasibility Study and Maiden Ore Reserve (“**FS**”) details a 321 ktpa spodumene operation utilizing conventional open pit mining. Allkem’s spodumene expertise from the success of its Mt. Cattlin operations in Western Australia has been applied to the design and development of the James Bay Project. The FS suggests that James Bay Project will be the most competitive operation in the region with the lowest capital and operating costs. Shallow, high-grade mineralization with favourable infrastructure also supports the low-cost operation. Allkem has published a mineral resource estimate of 40.3 Mt @1.40% Li₂O ([FS summary here](#)) and mineralization is still open.

Stria launched its first full drilling program at its Pontax project in 2017, completing seven holes for a total of 911.4 m. All seven holes intersected spodumene - bearing pegmatite dykes grading from 0.65% Li₂O to 2.49% Li₂O over a minimum of 1.0 m ([Stria Lithium web site](#)). The best intercept was 21.39m grading 1.16% Li₂O in drill hole 975-17-0142.

The Company’s 1,056 hectare Delta Lake Lithium project (“**Delta Lake**”) is located 55 km southeast of Allkem’s James Bay Lithium Project and 20 km north of Critical Elements Lithium Corp. (TSXV: CRE) (“**CEL**”) Rose Lithium Project.

The geological environment in the northwestern portion of Delta Lake is similar to that hosting Allkem’s lithium mineralization. According to the Québec Ministère de l’Énergie et des Ressources Naturelles (“**MERN**”) this zone is characterized by the abundance of S-type pegmatitic granite intrusions, a lithology known for its Be, Li, Nb, and Ta potential. Beryl (a beryllium silicate mineral) is reported in several outcrops within this zone.

Allkem (55 km northwest) is proposing to develop a lithium mine at their James Bay Lithium Project, located adjacent to the Billy Diamond Highway which provides access to key infrastructure in the region. The 2021 Feasibility Study and Maiden Ore Reserve (“**FS**”) details a 321,000 tonne per year operation utilizing conventional open pit mining. Allkem’s spodumene expertise from the success of its Mt. Cattlin operations in Western Australia has been applied to the design and development of the James Bay Project. The FS suggests that James Bay Project will be the most competitive operation in the region with low capital and operating costs. Shallow, high-grade mineralization with favourable infrastructure also supports the low-cost operation. Allkem has published a mineral resource estimate of 40.3 Mt @1.40% Li₂O ([FS summary here](#)) and mineralization is still open.

CEL’s Rose Lithium-Tantalum mine (20 km south) is anticipated to start production in approximately 21 months. The mine will excavate a total of 26.3M tonnes ore grading an average of 0.87% Li₂O and 138 ppm Ta₂O₅ after dilution. The mill will process 1.61M tonnes of ore per year to produce an annual average of 224,686 tonnes of technical and chemical grade spodumene concentrates and 441 tonnes of tantalite concentrate. The ore is contained in several parallel and continuous shallow dipping pegmatite dykes outcropping on surface. The ore zones are open at depth and a future underground operation is possible. Over the life of mine, the open pit will excavate a total of 182.4M tonnes of waste rock and 10.9 M tonnes of overburden. The average strip ratio is 7.3 tonnes of waste per tonne of ore. ([CEL website](#)).

Forward-Looking Information: *This release includes certain statements that may be deemed "forward-looking statements". All statements in this release, other than statements of historical facts, that address any activities and events or developments that Arctic Fox Lithium Corp. ("Arctic Fox") expects to occur, are forward-looking statements. Although Arctic Fox believes the expectations expressed in such forward-looking statements are based on reasonable assumptions, such statements are not guarantees of future performance and actual results or developments may differ materially from those forward-looking statements. Forward-looking statements in this press release include, but are not limited to, statements relating to: the timing and potential benefits of the fieldwork described in this press release; and the future potential of and exploration on the properties described in this press release. Factors that could cause actual results to differ materially from those in forward looking statements include the failure to complete the fieldwork on the timing and terms as contemplated or at all; uncertainty with respect to the results of future exploration and the ability to conduct any exploration activities on the properties described in this press release; market prices; disruptions relating to the COVID-19 pandemic; continued availability of capital and financing; and general economic, market or business conditions. These statements are based on a number of assumptions including, among other things, assumptions: regarding general business and economic conditions; that Arctic Fox will have the necessary resources (financial and otherwise) required to conduct anticipated exploration activities; and that the exploration work described in this press release will be completed as anticipated. Investors are cautioned that any such statements are not guarantees of future performance and actual results or developments may differ materially from those projected in the forward-looking statements. Arctic Fox does not assume any obligation to update or revise its forward-looking statements, whether as a result of new information, future events or otherwise, except as required by applicable law.*
