

# Bayridge Resources Completes Cash and Share Obligations Towards Initial 40% Earn-In at Its Athabasca Basin Uranium Properties

Vancouver, British Columbia--(Newsfile Corp. - May 10, 2024) - **Bayridge Resources Corp. (CSE: BYRG)** ("**Bayridge**" or the "**Company**") is pleased to announce that, pursuant to its definitive option agreements (the "**Option Agreements**") with CanAlaska Uranium Ltd. ("**CanAlaska**"), through which the Company may earn up to an 80% interest in each of CanAlaska's Waterbury East and Constellation Projects (the "**Projects**") in the Athabasca Basin, the Company has paid CanAlaska an aggregate of \$490,000 in cash (the "**Cash Payments**") and issued to CanAlaska an aggregate of \$685,000 worth of common shares (the "**Share Issuances**").

With this tranche of Cash Payments and Share Issuances complete, the Company now must incur exploration expenditures of \$1,500,000 within the next 18 months from the time of commencement (being March 25, 2024) at each of the Projects in order to earn its initial 40% interest in each of the Projects.

## About Bayridge Resources Corp.

Bayridge Resources Corp. is a green energy company advancing its portfolio of Canadian uranium and lithium projects. The 1,337 ha Waterbury East project is located 25 km northeast of the Cigar Lake Mine in the northeastern Athabasca Basin region. Geophysical surveys have identified a 7km long conductivity corridor where mid-2000's drilling highlighted faulted and altered basement rock with local uranium enrichment. Large sections of this corridor remain untested. The 11,142 ha Constellation project is located 60 km south of the present-day Athabasca Basin edge in an area of significant exploration activity for basement hosted uranium. Historic airborne radiometric, electromagnetic, and magnetic surveys identified electromagnetic conductors associated with magnetic lows. The 4,413 ha Sharp Lake project, located in the Red Lake Mining District of Northern Ontario, hosts peraluminous S-type muscovite bearing pegmatite bearing granites in contact with metasediments. Preliminary sampling has highlighted anomalous rare-element values, potentially indicative of lithium mineralization.
